

Using simple RGB Camera to estimate Nitrogen Uptake, Nitrogen Nutrition Index (NNI) and critical Nitrogen dilution (Nc): A case study of Spring wheat .

S. Sarig, E. Shlevin, A. Zilberman., I. Richker.,
M. Dudai,, S. Nezer and J. Ben Asher

The Katif R&D center Ministry of science ISRAEL

OBJECTIVES

- 1) To demonstrate the feasibility of digital camera to replace laboratory tests.
- 2) Use N% and dry matter yield (DM) in order to calculate N-uptake (rather than N%) by wheat as a tool for Decision Support System (DSS)
- 3) To Determine critical N dilution (N_c) and Nitrogen nutrition Index(NNI) of spring wheat

Definitions

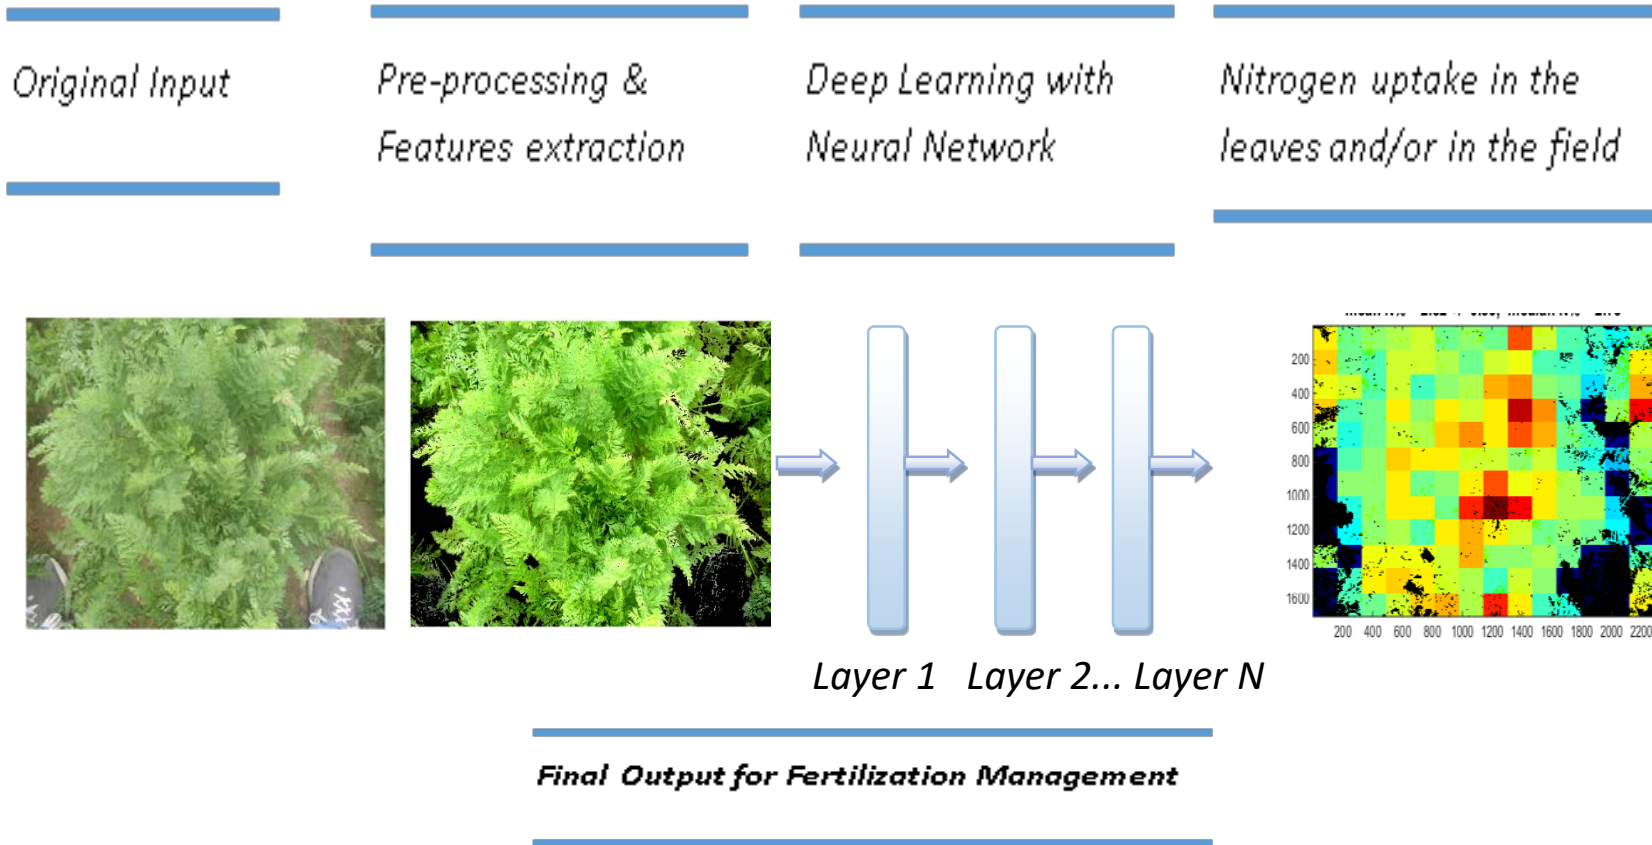

- 1) N-uptake = $\%N * DM / 100$;
- 2) Critical N dilution (N_c) : The minimum N concentration required for maximum crop growth (Greenwood et al., 1991).
- 3) Nitrogen nutrition Index (NNI)): $N_c / N_{c \max} = 1 / [1 + (DM / DM_{50})^b]$, where DM and DM_{50} are the DM (kg/ha). when $DM = DM_{50}$ then $N_c = 0.5 N_{c \max}$.
Shlevin et al. (2018)

Measurements used to obtain the results of the study:

- 1) Comparison of N-uptake between camera measurements and standard laboratory analysis.
- 2) Calculation of N-uptake by wheat:
$$\text{N-uptake} = \%N * \text{DM} / 100.$$
- 3) Nc calculation.
- 4) NNI estimation.

Demonstrate the feasibility of digital camera to replace laboratory tests.

The technology: Fertilization management via digital color imaging (real time monitoring)

- **Total nitrogen uptake by plant (kg/ha); Nutrients deficiency: NPK units (kg/ha); NPK application (kg/ha); Fertilizer N-P-K composition;** combining Computer Vision and Machine Learning techniques

Pre-Processing and final result

7

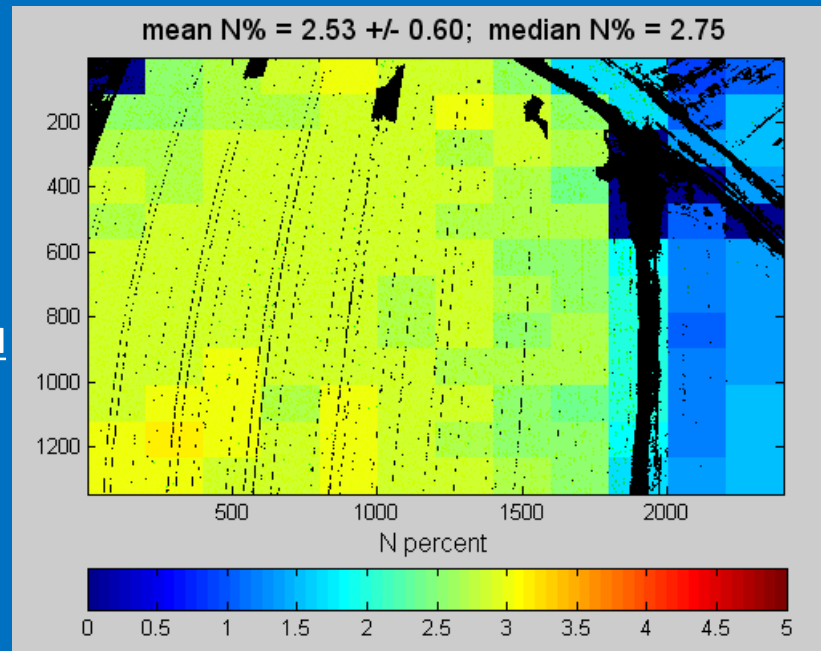

Original Image of wheat field

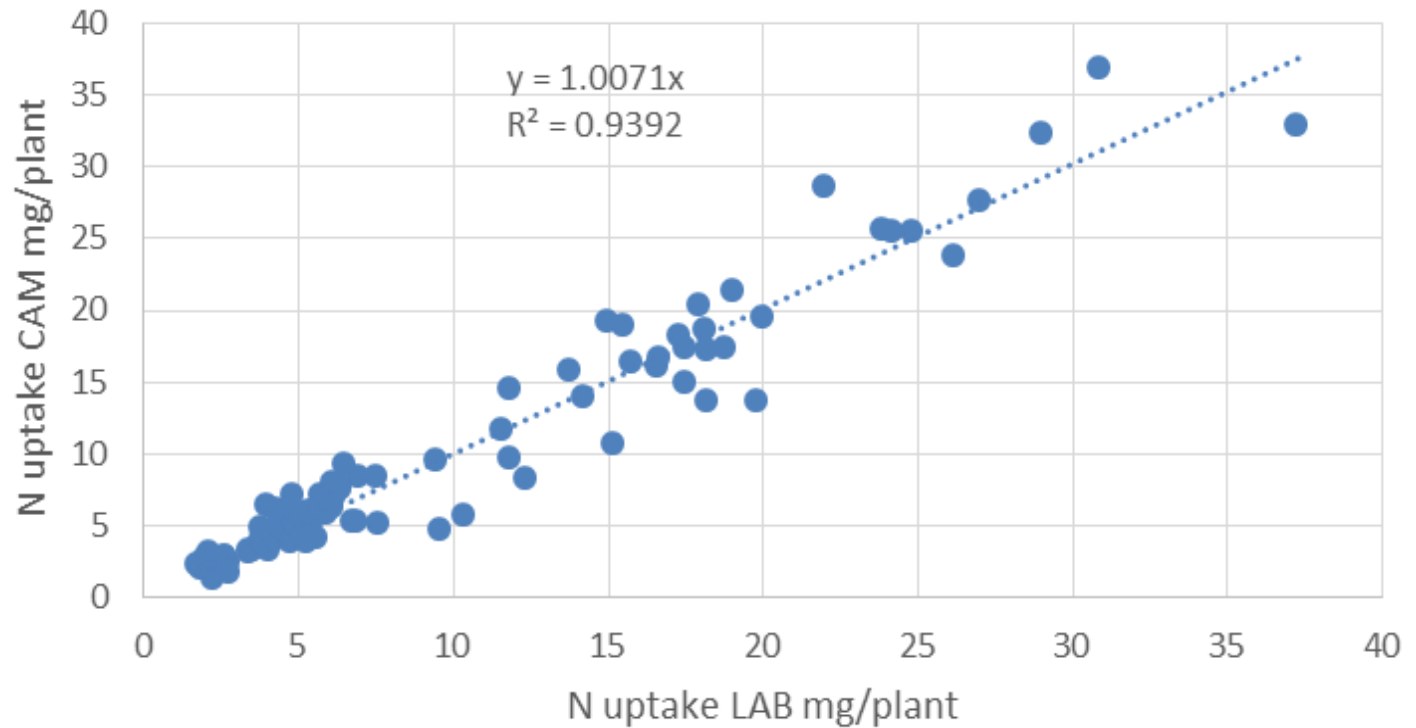

After pre-processing

Estimated N% in wheat field

N uptake for 4 treatments: Camera vs LAB

Nitrogen uptake by wheat. Comparisons between laboratory and camera of all data collected (120 data points).

Pre-Processing and final result

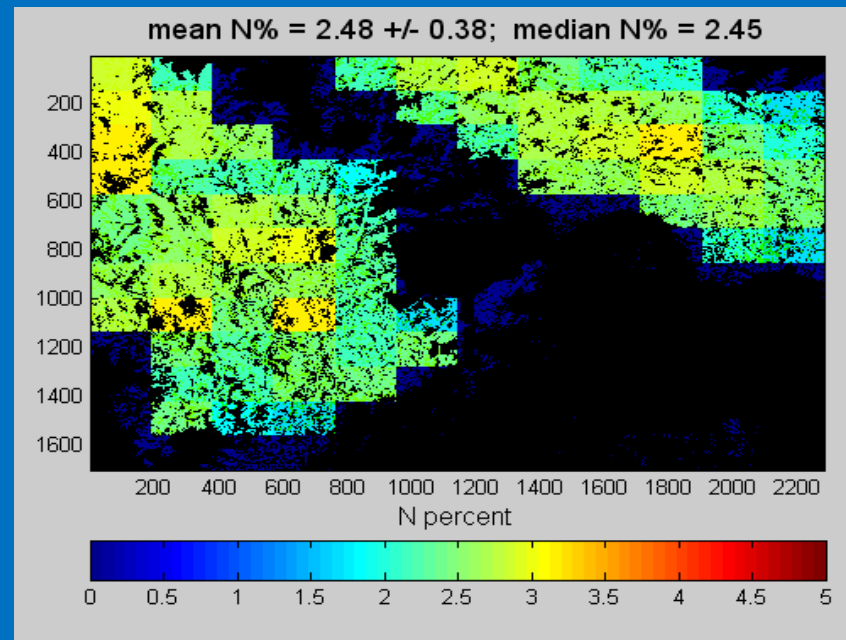

Original Image of carrots

After pre-processing

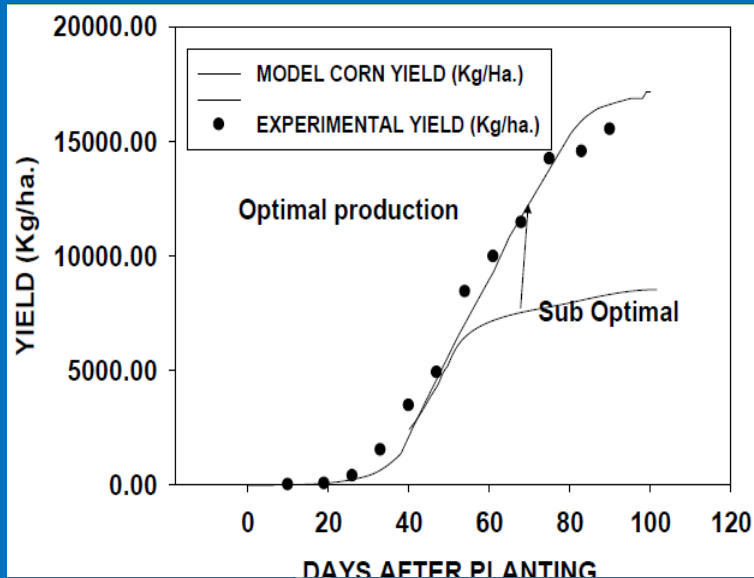

Estimated N%

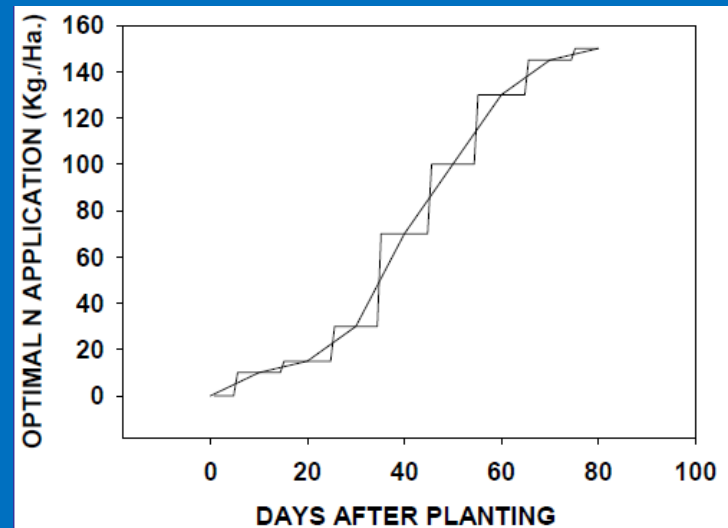

Use N% and dry matter yield (DM) in order to calculate N-uptake (rather than N%) by wheat as a tool for Decision Support System (DSS)

Decision Support System – optimal fertilization using digital color imaging

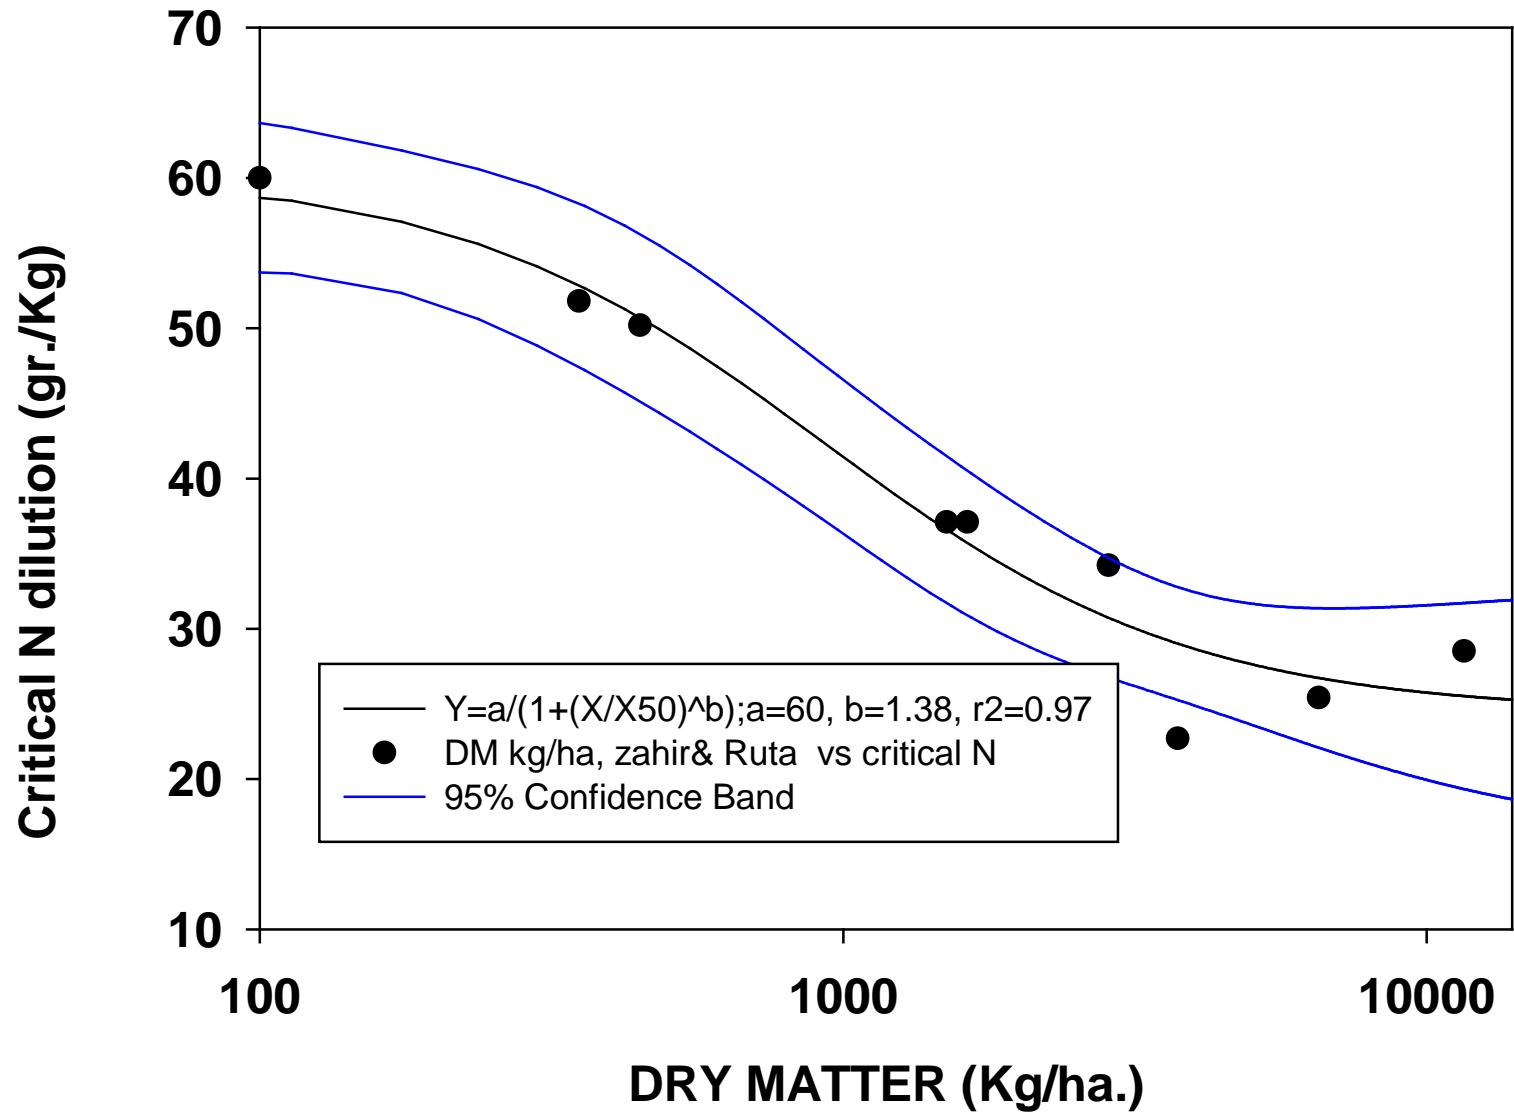

Translating target % N in the leaf to kg/ha N application in the field

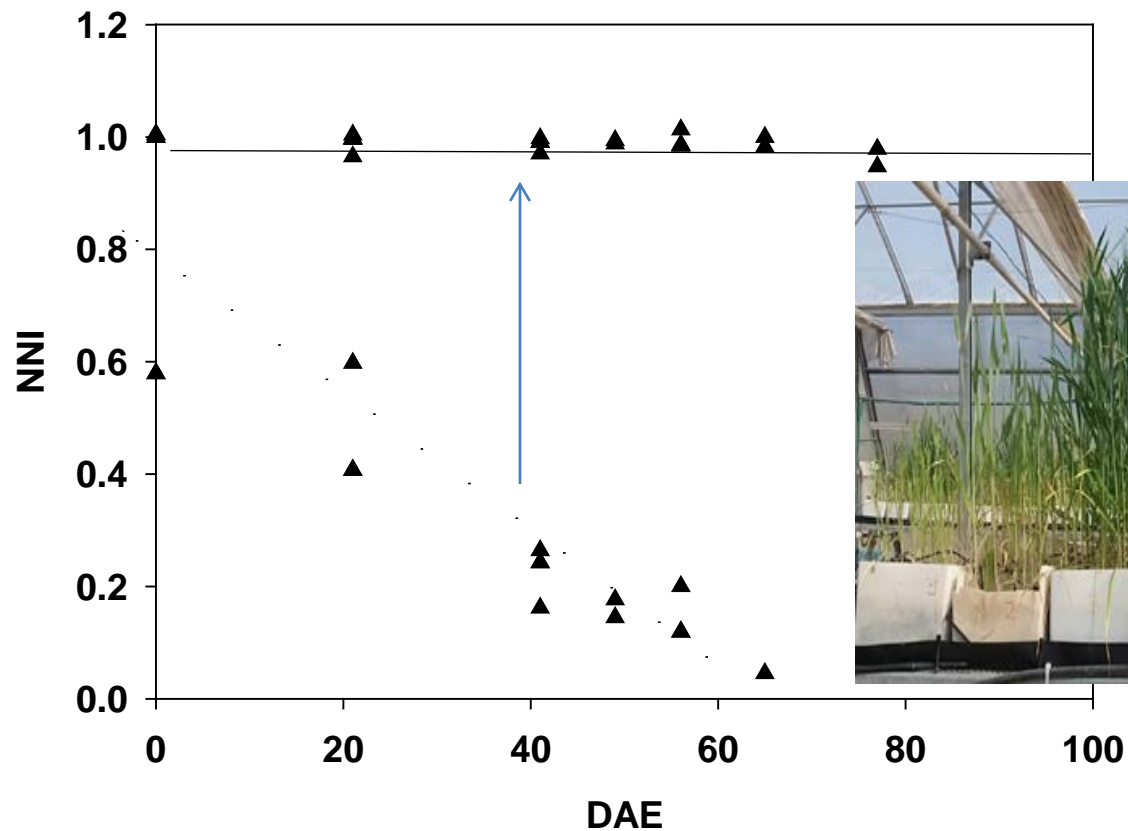

Optimal N consumption for maximal yield (expressed as cumulative application)

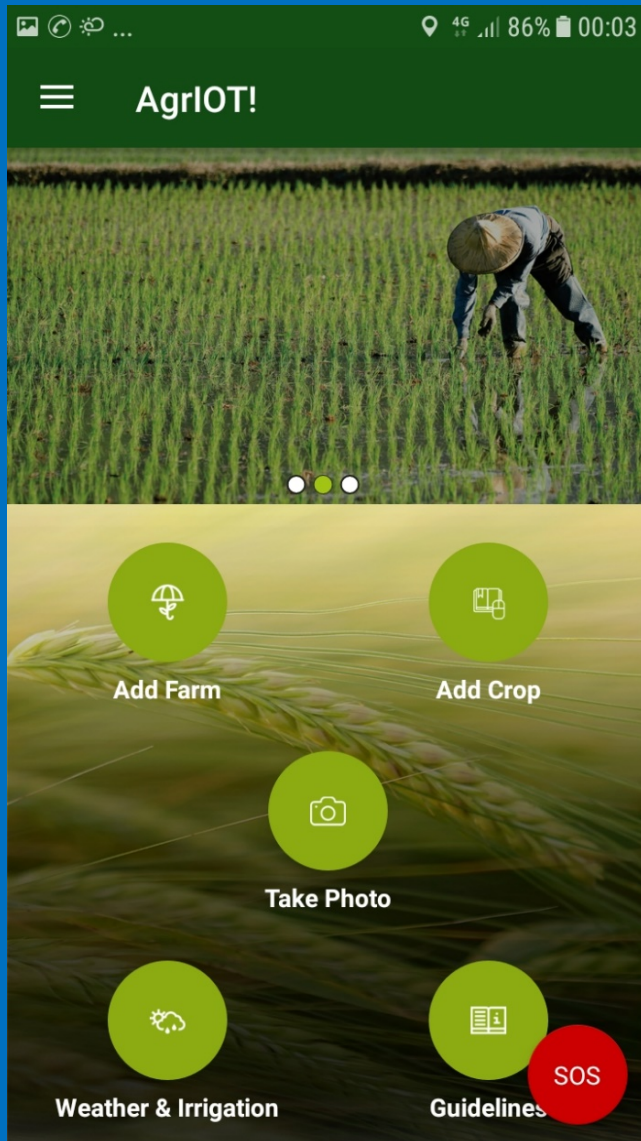

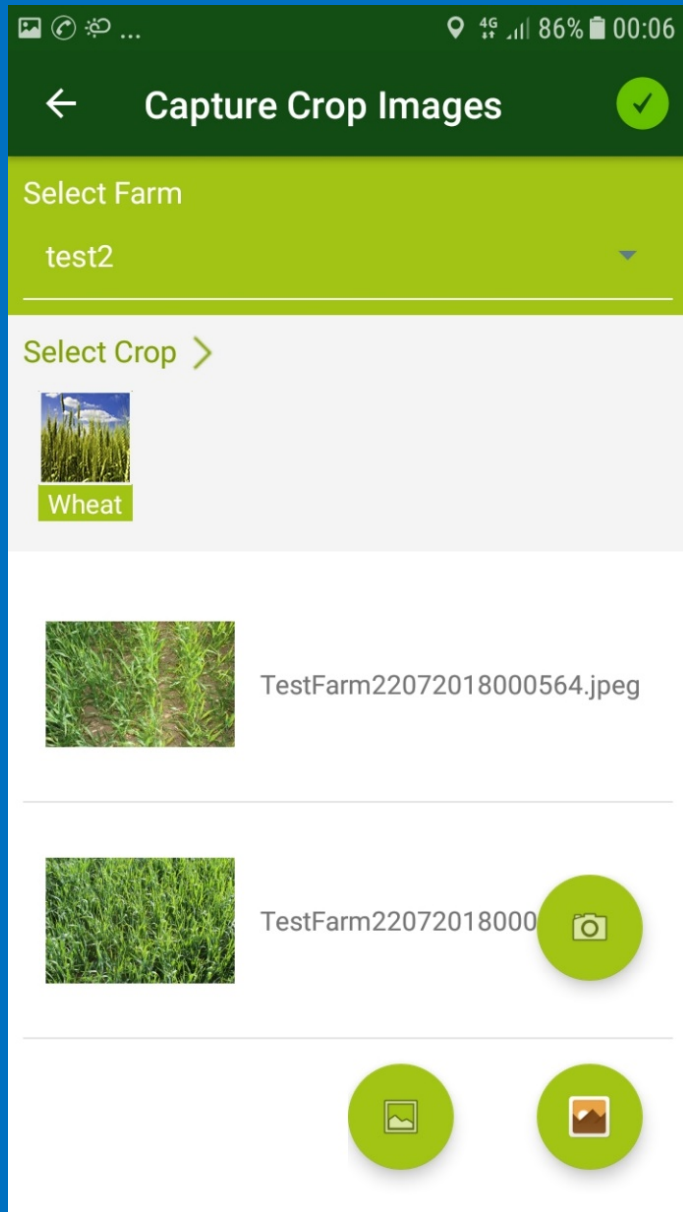

**Determine critical N dilution (N_c) and
Nitrogen nutrition Index (NNI) of spring
wheat**

The course of NNI during the growing stages of spring wheat in the green house. Dashed line No N application Solid line Critical N application

SUGGESTIONS !

N Uptake

Minimum	Maximum	
113	138	kg/ha

Add N Units

Minimum	Maximum	
30	36	kg/ha

Add Fertilizer

Urea

Minimum	Maximum	
68	75	kg/ha

Diammonium phosphate (DAP)

Minimum	Maximum	
18	20	kg/ha

MOP (potash)

Minimum	Maximum	
65	72	kg/ha

OKAY!

The novelty of our approach

**Its ability to estimate Nutrients uptake (NPK)
To support agronomic decisions(DSS)**

**Increasing use of computer to perform high precision
irrigation and fertilization tasks.**

The uniqueness of our method :

- Simplicity: Sensorless control;**
- Cheapness: No request to invest by the grower;**
- Availability: Smartphones and application are readily available to anyone and for every farming size**
- Monitoring and DSS rather than sampling**

Thank you for your attention.
